

Contents

1. Signal Processing	1
Objectives	
1.1 Motivation	
1.1.1 Digital and Analog Processing	
1.1.2 Total Harmonic Distortion (THD)	
1.1.3 A Notch Filter	
1.1.4 Active Noise Control	
1.2 Signals and Systems	
1.2.1 Signal Classification	
1.2.2 System Classification	
1.3 Signal Sampling	
1.3.1 Sampling as Modulation	
1.3.2 Aliasing	
1.4 Signal Reconstruction	
1.4.1 Reconstruction Formula	
1.4.2 Zero-order Hold	
1.5 Prefilters and Postfilters	
1.5.1 Anti-aliasing Filter	
1.5.2 Anti-imaging Filter	
*1.6 Conversion Circuits	
1.6.1 Digital-to-analog Conversion (DAC)	
1.6.2 Analog-to-digital Conversion (ADC)	
1.7 The FDSP Toolbox	
1.7.1 Driver Module: <i>f_dsp</i>	
1.7.2 GUI Modules	
1.7.3 Toolbox Functions	
1.7.4 Toolbox Help	
1.8 Software Applications	
1.8.1 GUI Module: <i>g_sample</i>	
1.8.2 GUI Module: <i>g_reconstruct</i>	
1.8.3 Anti-aliasing Filter Design	
1.9 Chapter Summary	
1.10 Problems	

1.10.1	Analysis	
1.10.2	GUI Simulation	
1.10.3	Computation	
2.	Discrete-Time System Analysis	77
	Objectives	
2.1	Motivation	
2.1.1	Home Mortgage	
2.1.2	Satellite Attitude Control	
2.1.3	Running-average Filter	
2.2	Z-transform Pairs	
2.3	Z-transform Properties	
2.3.1	Linearity Property	
2.3.2	Delay Property	
2.3.3	Z-scale Property	
2.3.4	Time Multiplication Property	
2.3.5	Initial and Final Value Theorems	
2.4	Inverse Z-transform	
2.4.1	Synthetic Division Method	
2.4.2	Partial Fraction Method	
2.4.3	Residue Method	
2.5	Transfer Functions	
2.5.1	The Transfer Function	
2.5.2	Zero-state Response	
2.5.3	Poles, Zeros, and Modes	
2.5.4	DC Gain	
2.6	Signal Flow Graphs	
2.7	The Impulse Response and Convolution	
2.7.1	Impulse Response	
2.7.2	Convolution	
2.7.3	FIR and IIR Systems	
2.8	Stability	
2.8.1	BIBO Stable	
2.8.2	The Jury Test	
2.9	Frequency Response	
2.9.1	Sinusoidal Inputs	
2.9.2	Periodic Inputs	
2.10	Software Applications	
2.10.1	GUI Module: <i>g_system</i>	

2.10.2	Home Mortgage	
2.10.3	Satellite Attitude Control	
2.10.4	The Fibonacci Sequence and the Golden Ratio	
2.11	Chapter Summary	
2.12	Problems	
2.12.1	Analysis	
2.12.2	GUI Simulation	
2.12.3	Computation	
3.	The DFT and Spectral Analysis169
	Objectives	
3.1	Motivation	
3.1.1	Fourier Series	
3.1.2	DC Wall Transformer	
3.1.3	Frequency Response	
3.2	The Discrete-time Fourier Transform (DTFT)	
3.3	The Discrete Fourier Transform (DFT)	
3.3.1	Roots of Unity	
3.3.2	Matrix Formulation	
3.3.3	Signal Spectra	
3.4	DFT Properties	
3.4.1	Linearity Property	
3.4.2	Periodic Property	
3.4.3	Symmetry Property	
3.4.4	Circular Shift Property	
3.4.5	Reflection Property	
3.4.6	Parseval's Theorem	
3.5	The Fast Fourier Transform (FFT)	
3.5.1	Decimation in Time FFT	
3.5.2	FFT Computational Effort	
3.5.3	Alternative FFT Implementations	
3.6	White Noise	
3.6.1	Uniform White Noise	
3.6.2	Gaussian White Noise	
3.7	Discrete-time Frequency Response	
3.8	Zero Padding	
*3.9	Power Density Spectrum Estimation	
3.9.1	Bartlett's Method	
3.9.2	Welch's Method	

*3.10	The Spectrogram	
3.11	Software Applications	
3.11.1	GUI Module: <i>g_spectra</i>	
3.11.2	Signal Detection	
3.11.3	Distortion Due to Clipping	
3.12	Chapter Summary	
3.13	Problems	
3.13.1	Analysis	
3.13.2	GUI Simulation	
3.13.3	Computation	
4.	Convolution and Correlation	260
	Objectives	
4.1	Motivation	
4.1.1	Modeling the Vocal Tract	
4.1.2	Range Measurement with Radar	
4.2	Convolution	
4.2.1	Linear Convolution	
4.2.2	Circular Convolution	
4.2.3	Zero Padding	
4.2.4	Deconvolution	
4.2.5	Polynomial Arithmetic	
4.3	Fast Convolution	
4.3.1	Fast Linear Convolution	
*4.3.2	Fast Block Convolution	
4.4	Cross-correlation	
4.5	Fast Correlation	
4.5.1	Circular Cross-correlation	
4.5.2	Fast Linear Cross-correlation	
4.6	Auto-correlation	
4.6.1	Auto-correlation of White Noise	
4.6.2	Power Density Spectrum	
4.7	Extracting Periodic Signals from Noise	
4.7.1	Estimating the Period of a Noisy Periodic Signal	
4.7.2	Extracting a Periodic Signal from Noise	
4.8	Software Applications	
4.8.1	GUI Module: <i>g_correlate</i>	
4.8.2	Echo Detection	
4.8.3	Speech Analysis and Pitch	

4.9 Chapter Summary	
4.10 Problems	
4.10.1 Analysis	
4.10.2 GUI Simulation	
4.10.3 Computation	
5. Filter Specifications and Structures	329
Objectives	
5.1 Motivation	
5.1.1 Filter Design Specifications	
5.1.2 Filter Realization Structures	
5.2 Filter Design Specifications	
5.2.1 Linear Design Specifications	
5.2.2 Logarithmic Design Specifications (dB)	
5.3 Linear-phase Filters	
5.3.1 Group Delay	
5.3.2 Linear-phase Zeros	
5.4 Minimum-phase and Allpass Filters	
5.4.1 Minimum-phase Filters	
5.4.2 Allpass Filters	
5.5 FIR Filter Realization Structures	
5.5.1 Direct Forms	
5.5.2 Cascade Form	
5.5.3 Lattice Form	
5.6 IIR Filter Realization Structures	
5.6.1 Direct Forms	
5.6.2 Parallel Form	
5.6.3 Cascade Form	
*5.7 FIR Finite Word Length Effects	
5.7.1 Binary Number Representation	
5.7.2 Input Quantization Error	
5.7.3 Coefficient Quantization Error	
5.7.4 Roundoff Error, Overflow, and Scaling	
*5.8 IIR Finite Word Length Effects	
5.8.1 Coefficient Quantization Error	
5.8.2 Roundoff Error, Overflow, and Scaling	
5.8.3 Limit Cycles	
5.9 Software Applications	
5.9.1 GUI Module: <i>g_filters</i>	

5.9.2 Highpass Elliptic Filter	
5.10 Chapter Summary	
5.11 Problems	
5.11.1 Analysis	
5.11.2 GUI Simulation	
5.11.3 Computation	
6. FIR Filter Design	425
Objectives	
6.1 Motivation	
6.1.1 First-order Differentiator	
6.1.2 Second-order Differentiator	
6.1.3 Signal-to-noise Ratio	
6.2 Windowing Method	
6.2.1 Truncated Impulse Response	
6.2.2 Windowing	
6.3 Frequency-sampling Method	
6.3.1 Frequency Sampling	
6.3.2 Transition-band Optimization	
6.4 Least-squares Method	
*6.5 Optimal Equiripple FIR Filters	
6.5.1 Minimax Error Criterion	
6.5.2 Parks-McClellan Algorithm	
*6.6 Specialized FIR Filters	
6.6.1 Differentiators	
6.6.2 Hilbert Transformers	
6.7 Software Applications	
6.7.1 GUI Module: <i>g_fir</i>	
6.7.2 Bandstop Filter Design: A Comparison	
6.8 Chapter Summary	
6.9 Problems	
6.9.1 Analysis	
6.9.2 GUI Simulation	
6.9.3 Computation	
7. Multirate Signal Processing	493
Objectives	
7.1 Motivation	

7.1.1	Narrowband Filter Banks	
7.1.2	Delay Systems	
7.2	Integer Sampling Rate Converters	
7.2.1	Sampling Rate Decimator	
7.2.2	Sampling Rate Interpolator	
7.3	Rational Sampling Rate Converters	
7.3.1	Single-stage Converters	
7.3.2	Multistage Converters	
7.4	Multirate Filter Realization Structures	
7.4.1	Polyphase Interpolator	
7.4.2	Polyphase Decimator	
7.5	Subband Processing	
7.5.1	Narrowband Filters	
7.5.2	Filter Banks	
*7.6	Oversampling ADC	
*7.7	Oversampling DAC	
7.8	Software Applications	
7.8.1	GUI Module: <i>g_multirate</i>	
7.8.2	Sampling Rate Converter (CD to DAT)	
7.9	Chapter Summary	
7.10	Problems	
7.10.1	Analysis	
7.10.2	GUI Simulation	
7.10.3	Computation	
8.	IIR Filter Design	550
	Objectives	
8.1	Motivation	
8.1.1	Tunable Plucked-string Filter	
8.1.2	Colored Noise	
8.2	Filter Design by Pole-zero Placement	
8.2.1	Resonator	
8.2.2	Notch Filter	
8.2.3	Comb Filters	
8.3	Filter Design Parameters	
8.4	Classical Analog Filters	
8.4.1	Butterworth Filters	
8.4.2	Chebyshev-I Filters	
8.4.3	Chebyshev-II Filters	

8.4.4	Elliptic Filters	
8.5	Bilinear Transformation Method	
8.6	Frequency Transformations	
8.6.1	Analog Frequency Transformations	
8.6.2	Digital Frequency Transformations	
8.7	Software Applications	
8.7.1	GUI Module: <i>g_iir</i>	
8.7.2	Reverb Filter	
8.8	Chapter Summary	
8.9	Problems	
8.9.1	Analysis	
8.9.2	GUI Simulation	
8.9.3	Computation	
9.	Adaptive Signal Processing	620

Objectives

9.1	Motivation	
9.1.1	System Identification	
9.1.2	Channel Equalization	
9.1.3	Signal Prediction	
9.1.4	Noise Cancellation	
9.2	Mean Square Error	
9.2.1	Adaptive Transversal Filters	
9.2.2	Cross-correlation Revisited	
9.2.3	Mean Square Error	
9.3	The Least Mean Square (LMS) Method	
9.4	Performance Analysis of the LMS Method	
9.4.1	Step Size	
9.4.2	Convergence Rate	
9.4.3	Excess Mean Square Error	
9.5	Modified LMS Methods	
9.5.1	Normalized LMS Method	
9.5.2	Correlation LMS Method	
9.5.3	Leaky LMS Method	
9.6	Adaptive FIR Filter Design	
9.6.1	Pseudo-filters	
9.6.2	Linear-phase Pseudo-filters	
9.7	The Recursive Least Squares (RLS) Method	
9.7.1	Performance Criterion	

9.7.2 Recursive Formulation	
9.8 Active Noise Control	
9.8.1 The Filtered- x LMS Method	
9.8.2 Secondary Path Identification	
9.8.3 Signal-synthesis Method	
*9.9 Nonlinear System Identification	
9.9.1 Nonlinear Discrete-time Systems	
9.9.2 Grid Points	
9.9.3 Radial Basis Functions	
9.9.4 Adaptive RBF Networks	
9.10 Software Applications	
9.10.1 GUI Module: <i>g_adapt</i>	
9.10.2 Identification of a Chemical Process	
9.11 Chapter Summary	
9.12 Problems	
9.12.1 Analysis	
9.12.2 GUI Simulation	
9.12.3 Computation	
References and Further Reading	724
Appendix A: Elements of MATLAB	729
A.1 Workspace	
A.2 Variables and Initialization	
A.3 Mathematical Operators	
A.4 Input and Output	
A.5 Branching and Loops	
A.6 Built-in Functions	
A.7 Graphical Output	
A.8 User-defined Functions	
A.9 GUIs	
Appendix B: FDSP Toolbox	740
B.1 Installation	
B.2 Driver Module: <i>f_dsp</i>	
B.3 Chapter GUI Modules	
B.4 FDSP Toolbox Functions	

Appendix C: Transform Tables	758
C.1 Fourier Series	
C.2 Fourier Transform	
C.3 Laplace Transform	
C.4 Z-transform	
C.5 Discrete-time Fourier Transform (DTFT)	
C.6 Discrete Fourier Transform (DFT)
